Solvents in marine coating solutions

Why is the role of solvents essential?

Marine coatings are a type of protective coating used in the marine environment to protect ships, vessels, tankers, but also other materials such as ship propellers, buoys, or structures on offshore wind park foundations or oil rigs from pitting and bacterial corrosion in water. Long-term resistant coating systems with no need for future refurbishment – combined with flawless application operation activities – are essential, as offshore repair is difficult. As ships and structures that are exposed above or below water, various corrosion protection systems are applied to improve safety, maintain appearance and reduce maintenance costs. Coatings with a blend of solvents are used to achieve optimum solvency and regulate the drying time which needs to be quick.
